

Apheresis in Kidney Transplantation

Is There Still a Place in the Era of New Therapies?

Johan Noble, MD PhD

Outline

1 Antibody-Mediated Rejection (ABMR) *Plasmapheresis, Immunoadsorption : what evidence in 2026?*

2 Desensitization in ABO & HLA incompatible KTx *The backbone of pre-transplant preparation*

3 Recurrence of Nephropathy Post-KTx *FSGS, MPGN : when apheresis changes the game*

? The Big Question *Anti-CD38, bispecifics, Imlifidase, CAR-T ... will they replace apheresis?*

Apheresis: Mechanism of Action in Antibody-Mediated Diseases

Plasmapheresis (PP)

Non-selective removal of all
plasma proteins

Double Filtration (DFPP)

**Selective for large
molecules**

Immunoadsorption (IA)

**Specific or semi-specific
antibody** removal
Protein A, anti-IgG, or antigen columns

Key Antibody Targets in Kidney Transplantation:

Anti-HLA DSA

ABO isoagglutinins

Anti-nephrin
(FSGS)

ANCA

Anti-Factor H / I
(aHUS)

1

Antibody-Mediated Rejection (AMR)

Evidence for apheresis and its limits in 2026

ABMR Treatment: Historical Evidence for Plasmapheresis

- **Soulillou et al. 1983** : First reports of PE in acute humoral rejection (no effect)
- **Allen et al. 1983** : Controlled trial: PE in acute renal allograft rejection (no effect) (N=13 & 14)
- **Böhmig et al. 2007** : RCT (n=10): Immunoadsorption in severe C4d+ acute rejection (IA): ↗graft survival (N=5 & 5)
- **Rocha et al. 2003** : PE + IVIg: similar outcomes on graft survival in early AMR versus TCMR (N=16)
- **Slatinska et al. 2009** : PP ± IVIg: improved patient & graft survival (N=13 & 11)

Patient survival

Graft survival

AMR: IVIg Alone vs PP + IVIg + Rituximab (retrospective, monocentric)

n=12 patients

IVIg
2000-2003
2g/kg × 4
Every 3 weeks

n=12 patients

**IVIg +
PE + Rituximab**
2004-2005
PP/d
IVIg 2g/kg × 4
RTX 375 mg/m² × 2

Immunodominant DSA

Graft survival

RITUX-ERAH: Prospective RCT (Rituximab)

40 patients with acute ABMR : PLEX + IVIg + Steroids ± Rituximab 375 mg/m²

	Placebo	+ Rituximab	
Graft survival at 1 / 7 years	94.7% / 55%	94.7% / 44%	NS
Primary endpoint (graft loss Or loss of function <30%)	52.6%	57.9%	NS
DSA MFI <2000 at M12	40%	76.5%	p<0.04 ✓

Key message: Rituximab significantly reduced DSA levels at 1 year but did NOT improve graft survival or function

Imlifidase vs Plasmapheresis in AMR

30 patients, 14 centers, 6-months open-label RCT: Imlifidase (n=18) vs PLEX (n=10)

Imlifidase

- DSA reduction at **day 5**: 97%
- Achieves non-complement-fixing levels
- DSA rebound days 6-12
- 4/18 graft losses at 6 months
- KM graft survival: 78%

Plasmapheresis

- DSA reduction at **day 5**: 42%
- Fails to reach non-complement-fixing levels
- More sustained DSA reduction
- 1/10 graft losses at 6 months
- KM graft survival: 89%

eGFR slightly higher in PLEX

ASFA Guidelines: Apheresis in ABMR (2023)

Category I: first-line therapy

AMR in kidney transplantation

1B

Strong recommendation, moderate evidence

Standard protocol:

- PP or IA: 5-10 sessions
- IVIg 100mg/kg after each session
- ± Rituximab
- Steroids

Transplantation, kidney, ABO
compatible

Antibody-mediated rejection

TPE/IA

2

Desensitization ABO & HLA Incompatible KTx

*Apheresis as the cornerstone of pre-transplant preparation
For which benefit ?*

ABO-Incompatible KTx: Apheresis is the gold-standard (so far)

~30%

Of potential living donors
are ABO-incompatible

32%

expanded access
to transplantation

$\leq 1:8$

target isoagglutinin
titer pre-KTx

Accommodation post-KTx
reduces most of
humoral rejection risk

Why rituximab alone is not enough:

- Habicht et al. (NDT 2011): Rituximab alone reduced isoagglutinin titers, but only apheresis reliably achieves $\leq 1:8$ threshold required for safe transplantation
- Apheresis allows to achieves rapid isoagglutinin clearance before transplant with good outcomes

Transplantation, kidney, ABO
incompatible

Desensitization, living donor
Antibody mediated rejection

TPE/IA
TPE/IA

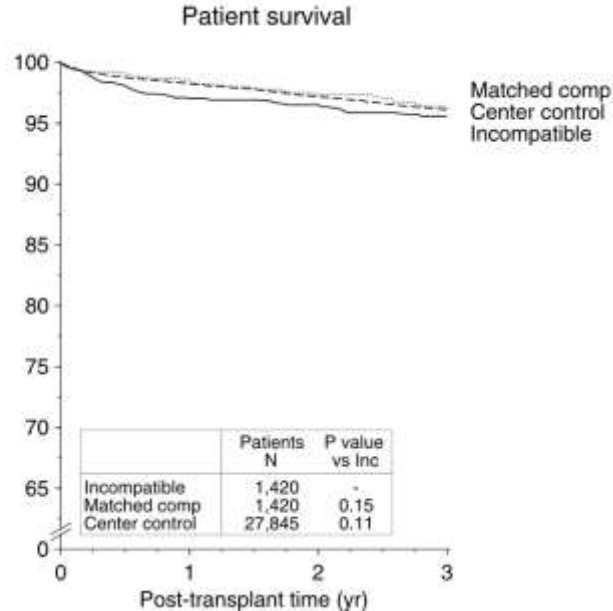

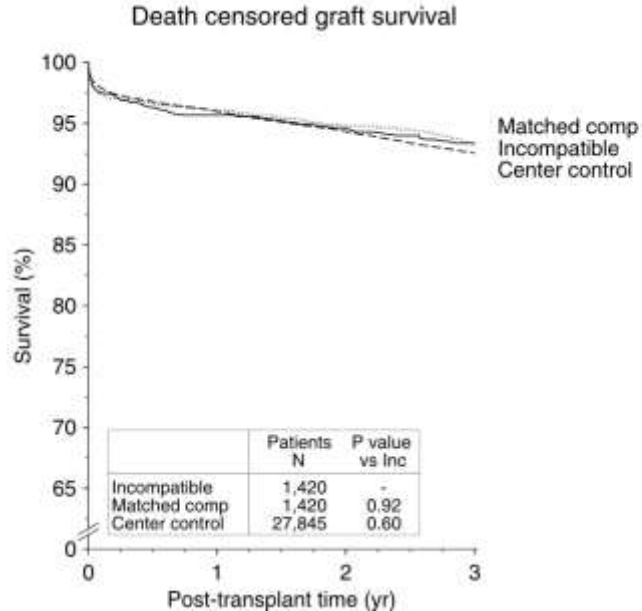

I
II

1B

259

ABOi KTx: Outcomes vs ABO-Compatible Transplantation

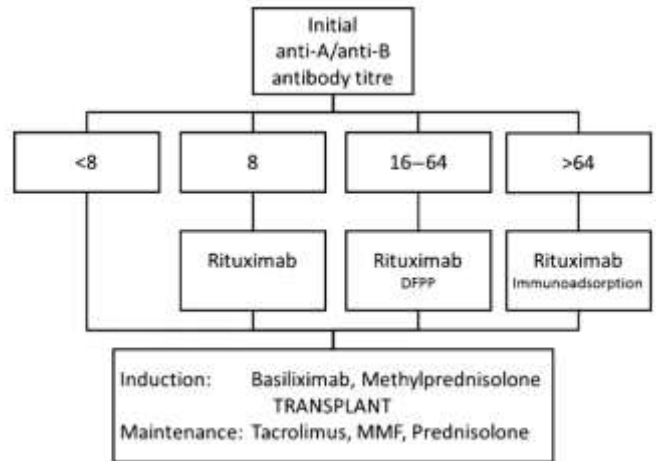

- ABOi : 1 420 patients
- Matched ABOc : 1 420 patient
- Control cohort : 27 845 patients

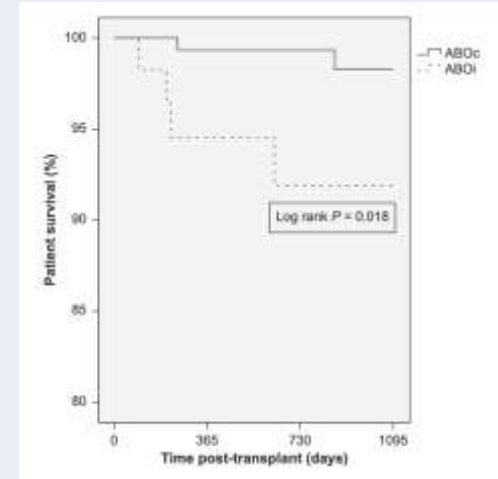

ABO antibody reduction by column **adsorption** was associated with similar death-censored graft survival to **plasmapheresis**

Tailored Desensitization According to Isoagglutinin Titer

Modified protocol according to ABGA titer:

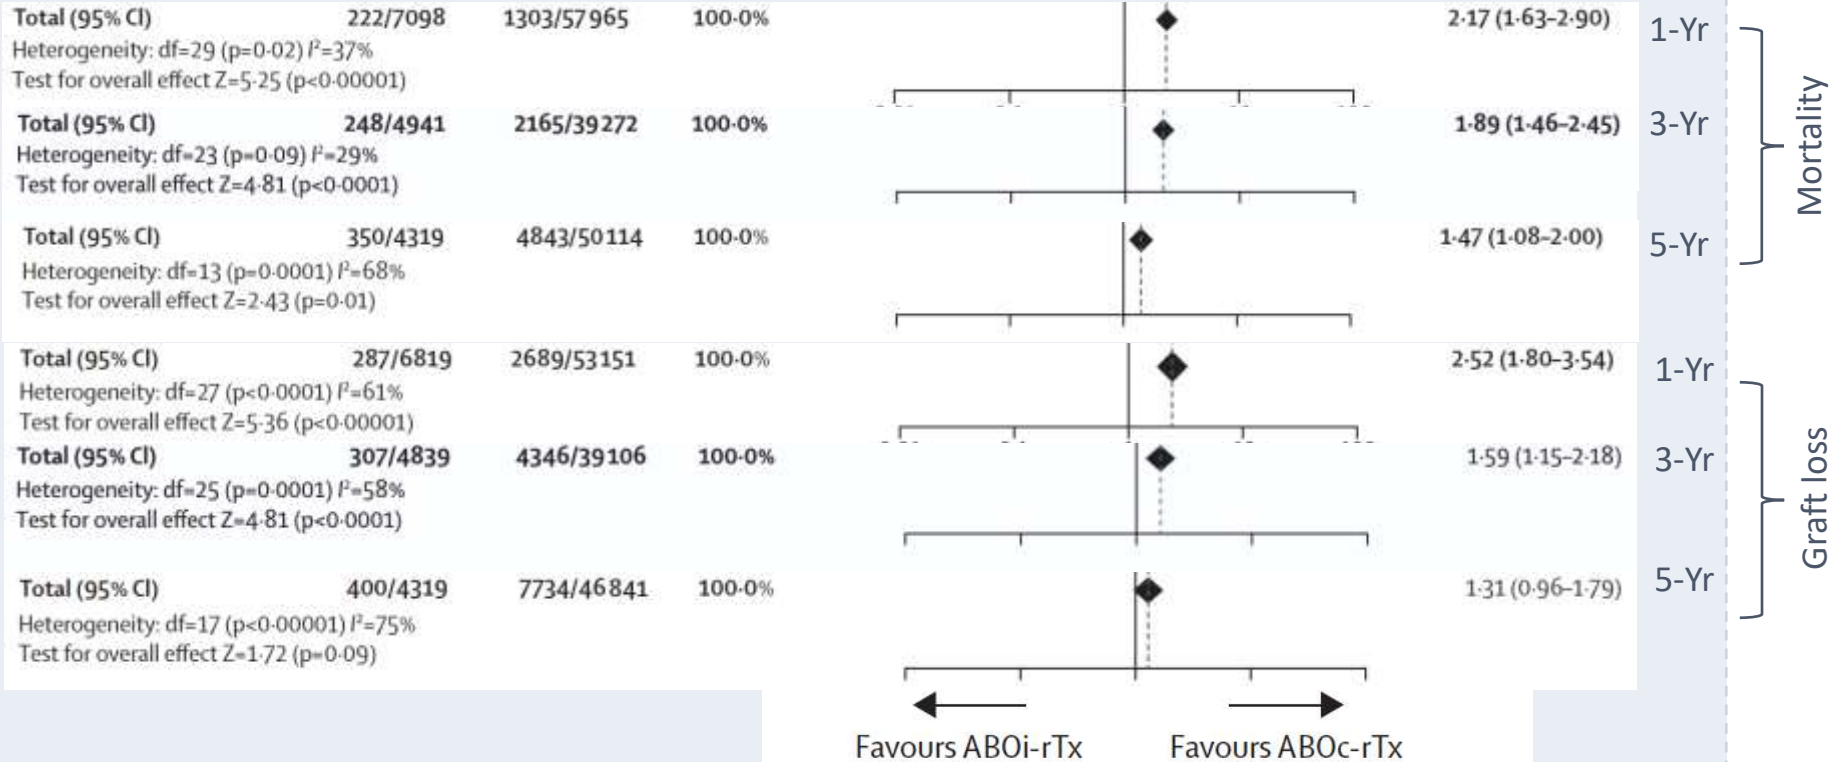

Death censored
graft survival

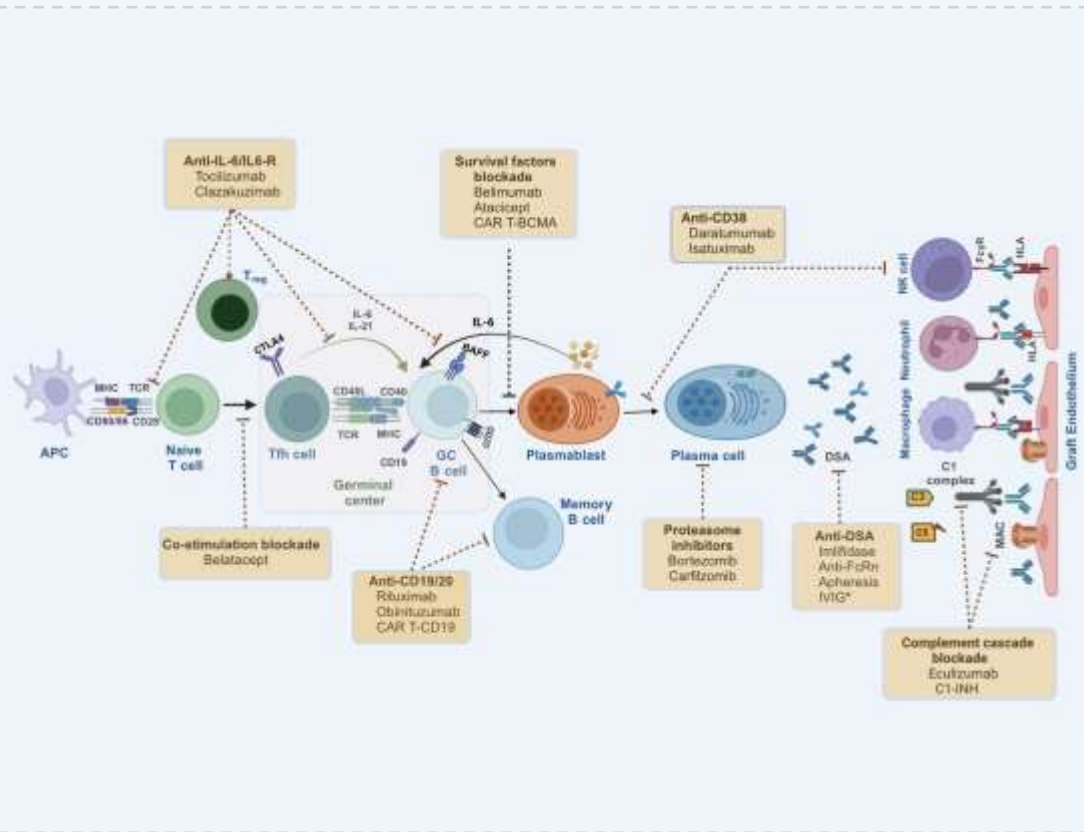

Patient survival

- **High titer** ($\geq 1:1024$): extended IA sessions until $\leq 1:8$: good results
- Low/moderate titer: standard 4–6 sessions of specific IA or DFPP : comparable outcomes

Clinical Outcomes After ABOi Renal Transplantation: Metaanalysis

HLA-Incompatible KTx: Desensitization Strategies

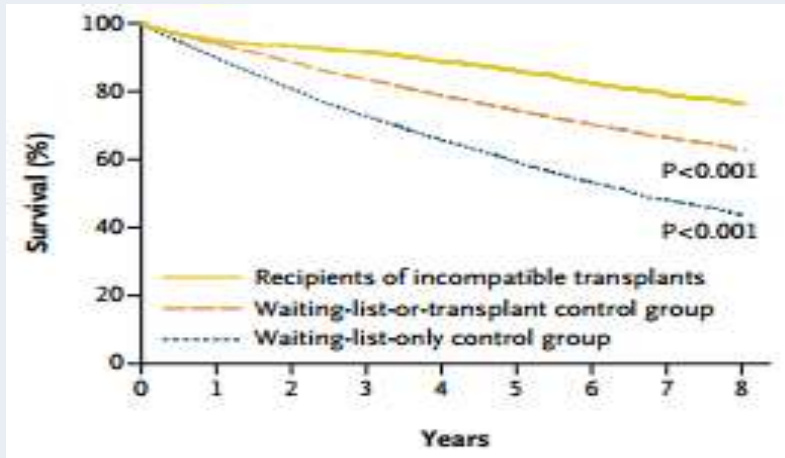

Current stepwise approaches:

PP / IA	Pre-tx DSA reduction
+ IVIg	Suppress antibody rebound
+ RTX	B-cell depletion
± Eculizumab	Complement inhibition

Individualized = based on DSA MFI & crossmatch

Survival Benefit with KTx from HLA-Incompatible Live Donors

USA

22 centers
 1025 HLAi
 5125 matched patients

UK

213 HLAi
 852 matched patients

Living donors

Survival Benefit with KTx from HLA-Incompatible - Grenoble experience

- **326 highly sensitized** waitlisted patients (26 desensitized, 30 transplanted)
- **Patient Survival:** No difference between desensitized KT, non-desensitized KT, and waitlisted patients (HR = 0.48, $p = 0.22$)
- **Death-Censored Graft Survival:** Similar
- **1-Year Graft Function:** Equal mean eGFR (53.3 vs. 53.6 mL/min/1.73m², $p = 0.95$).

Apheresis Efficacy & Tolerance in HLA-Incompatible KTx

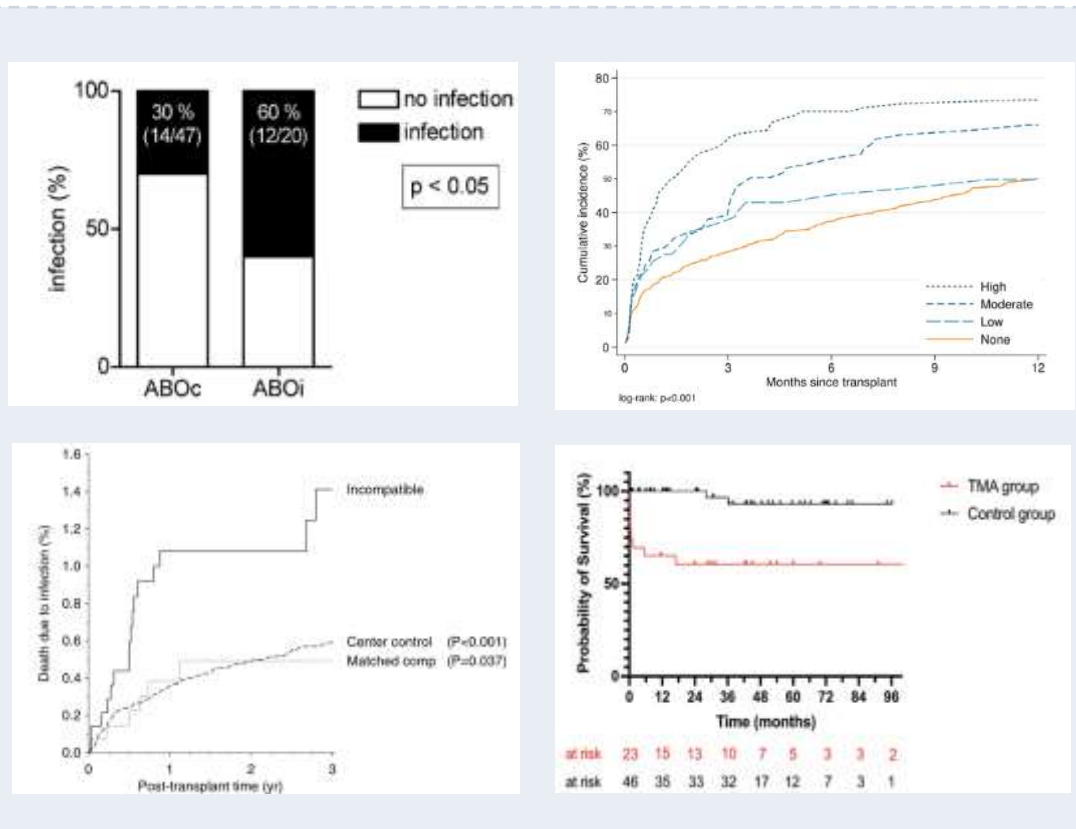

Table 5. Biological parameters according to apheresis techniques.

	DFPP (N = 107)	PE (N = 54)	IA (N = 720)	Total (N = 881)	p-Value
Pre-post IgA evolution (%) Median [IQ]	-65 (-45; -63)	-48 (-1; -71)	-14 (-7; -21)	-17 (-8; -29)	<0.01
Pre-post IgG evolution (%) Median [IQ]	-40 (-31; -50)	-61 (-48; -73)	-60 (-33; -70)	-56 (-33; -69)	<0.01
Pre-post IgM evolution (%) Median [IQ]	-37 (0; -58)	-51 (60; -75)	-17 (0; -54)	-17 (0; -57)	0.10
Pre-post Alb evolution (%) Median [IQ]	1 (14; 2)	10 (14; -3)	9 (14; -1)	9 (15; 0)	0.73
Pre-post fibrinogen evolution (%) Median [IQ]	-61 (-56; -69)	-33 (-29; -64)	-43 (-22; -57)	-47 (23; -60)	<0.01
Pre-post hemoglobin evolution (%) Median [IQ]	15 (22; -8)	2 (10; -2)	2 (9; -2)	3 (11; -2)	<0.01
Pre-post leukocytes Evolution (%) Median [IQ]	65 (96; 33)	22 (60; 5)	4 (18; 8)	8 (27; 6)	<0.01
Pre-post platelet evolution (%) Median [IQ]	7 (-1; 17)	14 (2; 21)	12 (3; 21)	12 (2; 21)	0.01

severe adverse events occurred in 17 sessions (1.9%)

- 107 DFPP, 54 PE, 720 IA.
- Volume of treated plasma significantly associated with IgG reduction post-apheresis (**IA requires a greater volume**)
- DFPP less efficient on class II
- **Monet filter** (cascade IA): significantly higher reduction of IgG, IgM and IgA vs IA alone

Risks associated with PE in desensitized patients: infections, TMA, death

Correlation between intensity of apheresis and infectious risk

- Intensity of apheresis correlates directly with infectious risk
- Prophylaxis: cotrimoxazole + penicillin V
- Anti-meningococcal (Nimenrix + Bexsero) + anti-pneumococcal (Prevenar 13)
- IVIg 0.1g/kg if IgG < 2g/L post-session

3

Post-KTx Nephropathy Recurrence

FSGS, MPGN, MN..

may apheresis improve graft survival ?

FSGS Recurrence Post-KTx: Epidemiology

32%

FSGS recurrence rate

39%

graft loss in recurrers
median 5 years

81%

treated with
PP + Rituximab

57%

partial or complete
remission with treatment

Risk factors for recurrence:

- **Older age** at onset of native kidney disease (HR 1.37/decade), **lower BMI**, prior native **nephrectomy** (HR 2.76)
- Circulating permeability factor: **anti-nephrin** autoantibodies emerging as key mediator
- Partial or complete remission significantly associated with better graft survival

FSGS Recurrence: PE + Rituximab

- PP removes **circulating permeability factor** (anti-nephrin Ab?)
- Remission rates higher with combined PP + RTX than RTX alone
- **Prophylactic PP** pre-KTx in high-risk patients ?
- **Response to PP** predicts graft outcome

Key References

Dantal J et al. N Engl J Med 1994 (**N=8**)

Deegens JK et al. Transpl Int 2004 (**N=13 vs 10**)
Graft survival 85% and 30%, respectively, at 5 years (P=0.02)

Hickson LJ et al. Transplantation 2009 (**N=30**)
pediatric cohort

Garrouste et al. Transplantation 2017 (**N=19**)

Canaud G et al. Am J Transplant 2009 (**N=10 vs 10**)

Uffing A et al. CJASN 2020 (**N=176**)

FSGS Recurrence: PE + Immunosuppression (open label, non-randomized)

- FSGS recurrence
- 10 patients with Steroids + CsA + PE
- 19 controls

- Complete remission **90% vs 27%** controls ($p < 0.001$)
- 1 patient PE-dependant
- **Early initiation critical**
- 1-year biopsies did not show progressive interstitial fibrosis

FSGS Recurrence: PP + Rituximab

Table 3. Immunosuppressive treatment modalities for recurrent FSGS and corresponding outcomes

Treatment	No Remission	Partial Remission	Complete Remission	Total
Plasmapheresis	7 (28)	11 (44)	7 (28)	25
Plasmapheresis + rituximab	16 (53)	9 (30)	5 (17)	30
Immunoadsorption ^a	2 (67)	1 (33)		3
Rituximab only		1 (50)	1 (50)	2
Plasmapheresis + cyclophosphamide	1 (100)			1
Steroids only	5 (83)	1 (17)		6
Cyclosporine ^b	2 (67)	1 (33)		3
No treatment	5 (100)			5
Total	38 (51)	24 (32)	13 (17)	75

^aTwo patients dependent on immunoadsorption had received plasmapheresis and rituximab treatment without remission, one patient had received only rituximab and immunoadsorption.

^bPatients were switched from oral tacrolimus to oral cyclosporine. Treatment was not given intravenously.

- Graft survival higher with combined PP + RTX than RTX alone

MPGN Recurrence Post-KTx: retrospective & multicentric

- 220 KTx with biopsy proven MPGN
- 37 % of kidney failure
- 25% of recurrence

Variable	Univariate analysis	
	HR (95% CI)	P-value
Treatment with rituximab for recurrence		.16
No	1.00 (reference)	
Yes	0.47 (0.17–1.34)	
Treatment with plasma exchange for recurrence		.16
No	1.00 (reference)	
Yes	2.18 (0.73–6.52)	
Treatment with MMF dose increase for recurrence		.62
No	1.00 (reference)	
Yes	0.72 (0.20–2.65)	
Treatment with eculizumab for recurrence		.47
No	1.00 (reference)	
Yes	0.61 (0.16–2.36)	

- IC-MPGN: PP removes immune complexes and complement factors
- Complement-mediated: eculizumab cornerstone
- IA + Monet filter: removes complement more efficiently than IA alone
- Role of PP largely anecdotal : no RCT available

Membranous Nephropathy Recurrence ?

Hypothesized Mechanisms of Apheresis Efficacy

1 Anti-PLA2R antibody removal

2 Complement & cytokine clearance

Supported by case report efficacy in seronegative MN (Ma et al. Semin Nephrol 2013)

Key Clinical Evidence

12 patients, anti-PLA2R >170 U/mL, 5 daily IA sessions
Albumin ↑ significantly ($p < 0.001$) but no change in proteinuria
Antibody rebound on stopping IA

Hamilton The PRISM Trial JCA 2018

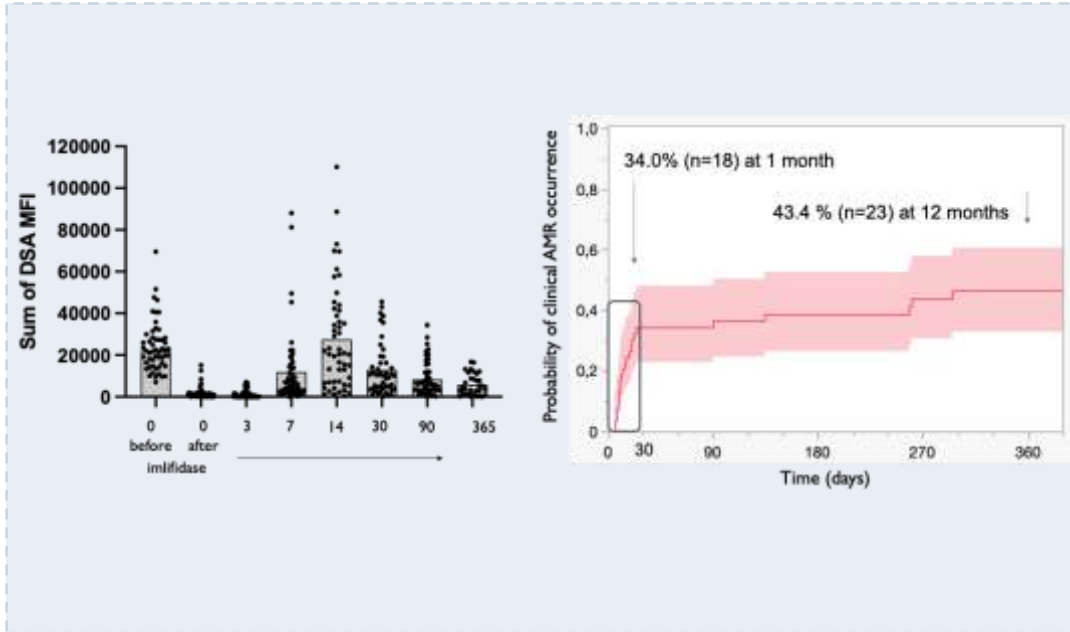

Apheresis in MN: evidence limited to case series: no RCT
Need for combined B-cell targeted therapy (RTX, Obinutuzumab) ?

The Big Question: Do New Therapies (will) replace apheresis?

Anti-CD38 | Bispecific antibodies | Imlifidase

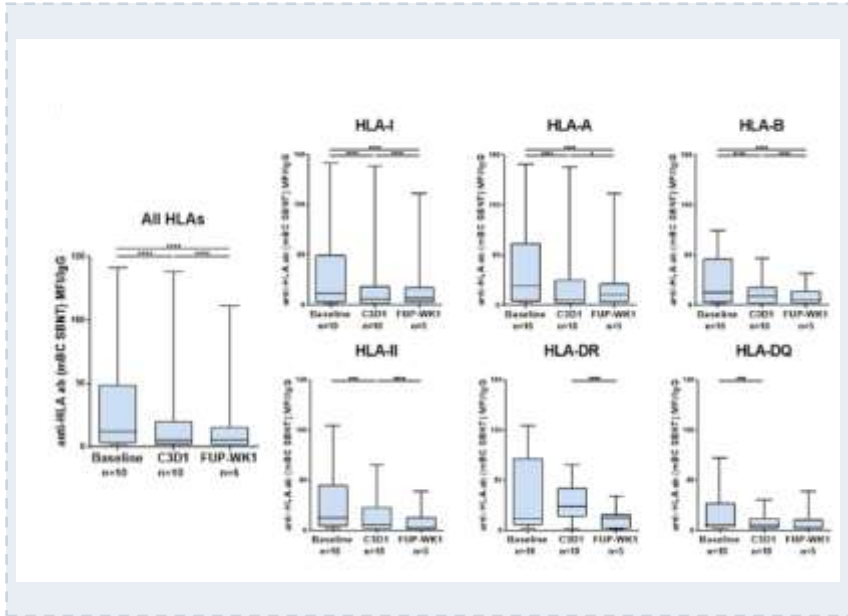

IgG Endopeptidase (Imlifidase) in Highly Sensitized Patients

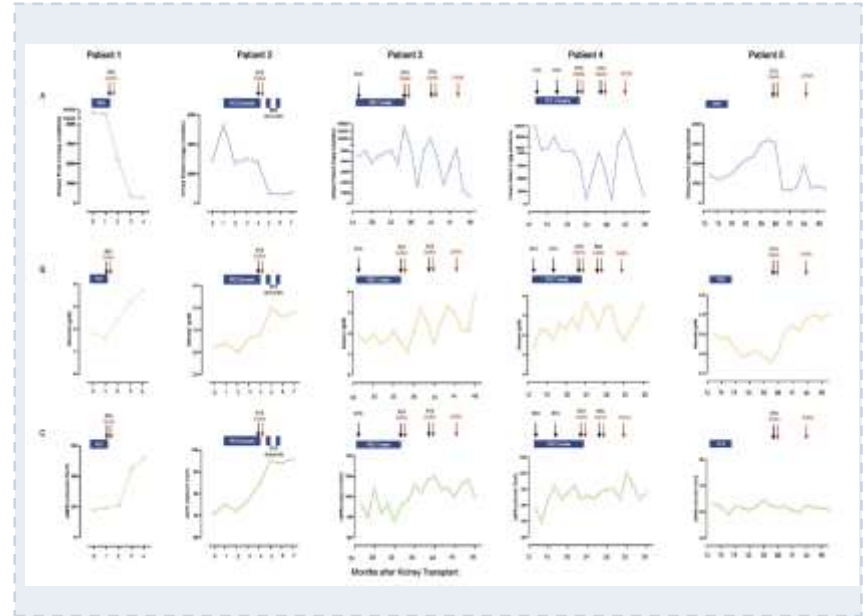

- Kjellman AJT 2021 : 39 patients
- AMR-: graft survival 93% | patient survival 85% at 3 years
- AMR+: graft survival 77% | patient survival 94% at 3 years
- ISKIA:
- Patient survival : 95.7% at 12 months
- Graft survival : 97.8% at 12 months

Antibody rebound D6–12 : maintenance IS essential; DSA recurrence remains the major challenge

Anti-CD38 (Daratumumab) in Kidney Transplantation

Desensitization / AMR

FSGS Recurrence: Sequential Rituximab + Daratumumab

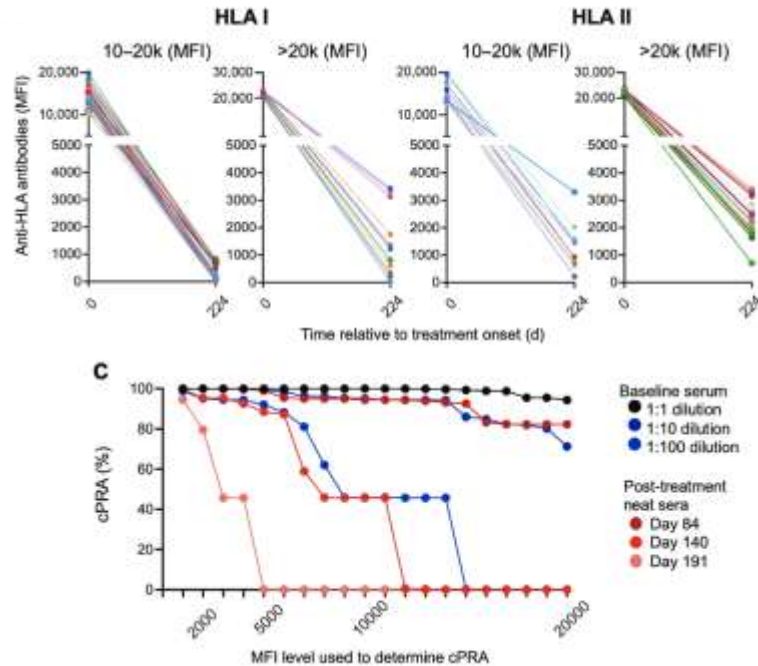

Felzartamab (Anti-CD38) in ABMR : Phase 2 RCT

- **Phase 2 RCT** : felzartamab vs placebo in active ABMR
- Significant **reduction of Banff ABMR scores** at 24 weeks
- Molecular phenotype improvement (IFTA, inflammation)
- DSA reduction
- Nat Med 2025: biopsy-level molecular effect confirmed

First RCT data for anti-CD38 in ABMR : promising, but combination with apheresis not yet defined

BCMA T-cell Engager + B-cell Depletion for Refractory HLA Sensitization

- Combination: **BCMA T-cell engager + anti-CD20 B-cell depletion**
- First clinical data in **refractory HLA-sensitized** transplant candidates
- Significant DSA reduction : enables access to transplantation in previously untransplantable patients

Proof of concept: deep immunological targeting may enable KTx without apheresis in highly sensitized patients

Serum anti-HLA antibodies		HLA-specific mBCs		
Serum dilution				
1:1	1:10			
2,000	< 1,000	Delisting ± post-Tx plasmapheresis and IVIG	No B cell-depleting agent	Negative
6,000			Rituximab	Positive
6,000	< 5,000	Imlifidase	Rituximab	Negative
20,000			Obinutuzumab	Positive
> 20,000	> 5,000	BCMA-specific TCE or CAR T	No B cell-depleting agent	Negative
Saturating Ab levels			Obinutuzumab Anti-CD19 CAR T	Positive

Anti-HLA MFI

Take-Home Messages

1

Apheresis remains efficient for rapid antibody removal

Proof of clinical efficacy is missing for some conditions

Benefit over Imlifidase ?

2

New therapies target the source

Anti-CD38, bispecifics efficiently deplete plasma cells?

3

The future may be improved sequential combination therapy *to sustained plasma cell suppression*

4

Evidence for new agents in transplant is still nascent *Mostly case series so far*

Congrès Médical 2016 - Néphrologie & Transplantation

Forum de l'Association des Néphrologues du Québec

17-18 Octobre 2016, Sheraton Québec, Québec

Programme des ateliers

17 Octobre

8h30 - 9h30 : Accueil et inscription

9h30 - 10h30 : Atelier 1 - Néphrologie

10h30 - 11h30 : Atelier 2 - Transplantation

11h30 - 12h30 : Déjeuner

12h30 - 13h30 : Atelier 3 - Néphrologie

13h30 - 14h30 : Atelier 4 - Transplantation

14h30 - 15h30 : Déjeuner

15h30 - 16h30 : Atelier 5 - Néphrologie

16h30 - 17h30 : Atelier 6 - Transplantation

17h30 - 18h30 : Dîner

18h30 - 19h30 : Conférence de clôture

19h30 - 20h30 : Accueil et inscription

20 Octobre

8h30 - 9h30 : Accueil et inscription

9h30 - 10h30 : Atelier 7 - Néphrologie

10h30 - 11h30 : Atelier 8 - Transplantation

11h30 - 12h30 : Déjeuner

12h30 - 13h30 : Atelier 9 - Néphrologie

13h30 - 14h30 : Atelier 10 - Transplantation

14h30 - 15h30 : Déjeuner

15h30 - 16h30 : Atelier 11 - Néphrologie

16h30 - 17h30 : Atelier 12 - Transplantation

17h30 - 18h30 : Dîner

18h30 - 19h30 : Conférence de clôture

19h30 - 20h30 : Accueil et inscription

21 Octobre

8h30 - 9h30 : Accueil et inscription

9h30 - 10h30 : Atelier 13 - Néphrologie

10h30 - 11h30 : Atelier 14 - Transplantation

11h30 - 12h30 : Déjeuner

12h30 - 13h30 : Atelier 15 - Néphrologie

13h30 - 14h30 : Atelier 16 - Transplantation

14h30 - 15h30 : Déjeuner

15h30 - 16h30 : Atelier 17 - Néphrologie

16h30 - 17h30 : Atelier 18 - Transplantation
